Eigen Values & Eigen Vectors

- **\rightharpoonup** Formal Definition: Let A be an $n \times n$ matrix.
 - \blacktriangleright An *eigenvector* of A is a *nonzero* vector x in \mathbb{R}^n such that $Ax = \lambda x$, for some scalar λ .
 - \triangleright An *eigenvalue* of A is a scalar λ such that the equation $Ax = \lambda x$ has a *nontrivial* solution.
- **Definition 2:** Roots of Characteristic equation of a square matrix is called the characteristics roots / latent roots / characteristic values/ eigen values / proper values of the matrix.ie. Eigenvalues of matrix are roots of $|A \lambda I| = 0$

If λ_1 is one of the eigenvalues of square matrix A then eigenvector (X) corresponding to λ_1 is given by $[A - \lambda_1 I]X = 0$.

Note

- Only square matrix possess eigenvalues.
- A square matrix of order n will have at the most n eigenvalues.
- Matrix of order n will have exactly n numbers of eigenvalues (may be distinct or repeated)
- Martix may have complex eigenvalues.

Question:

What is the Geometrical Interpretation of eigenvalues and eigenvectors? (find out)

Calculate Eigenvalues & Eigenvectors

- *Steps to be followed: A-square matrix of order n, I identity matrix of order n, λ any scalar (eigenvalue to be determined), X column vector of order n (eigenvector to be determined)
 - \triangleright Find Characteristic Matrix: $A \lambda I$
 - Find Characteristic equation: $|A \lambda I| = 0$
 - ➤ Solve Characteristic equation and find its roots. (roots are called eigenvalues)
 - For each eigenvalue, solve $[A \lambda I]X = 0$ to determine nonzero column vector X.

$$\lambda = 1$$
 is $\begin{bmatrix} -12 \\ 4 \\ 1 \end{bmatrix}$

Find eigenvalues and eigenvectors of

$$A = \begin{bmatrix} 4 & 6 & 6 \\ 1 & 3 & 2 \\ -1 & -5 & -2 \end{bmatrix}$$

Prove that corresponding eigenvectors are Linearly Independent.

Ans: 1,2,2
$$\begin{bmatrix} 4 \\ 1 \\ -3 \end{bmatrix}$$
, $\begin{bmatrix} 3 \\ 1 \\ -2 \end{bmatrix}$

Ex 5. Find eigenvalues and eigenvectors of

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & -3 & 3 \end{bmatrix}$$

$$|A - \lambda I| = 0$$

$$\begin{vmatrix} -\lambda & 1 & 0 \\ 0 & -\lambda & 1 \\ 1 & -3 & 3 - \lambda \end{vmatrix} = 0$$

$$\therefore \lambda^3 - 3\lambda^2 + 3\lambda + 1 = 0$$

 $\lambda = 1,1,1$ are the eigenvalues of A.

Sometyar TRUST

For
$$\lambda = 1[A - I]X = 0$$

$$\therefore \begin{bmatrix} -1 & 1 & 0 \\ 0 & -1 & 1 \\ 1 & -3 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = 0$$

$$R3+R1 \Rightarrow \begin{bmatrix} -1 & 1 & 0 \\ 0 & -1 & 1 \\ 0 & -2 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = 0$$

$$R3-2R2 \Rightarrow \begin{bmatrix} -1 & 1 & 0 \\ 0 & -1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = 0$$

$$\therefore x_2 = x_3 \&$$

$$\therefore x_1 = x_2$$

$$\therefore$$
 Eigen vector corresponding to $\lambda = 1$ is 1

n = no. of variable
= 3
r = no. of distinct
Equations/ Rank of echelon

Find eigenvalues and eigenvectors of

$$A = \begin{bmatrix} -3 & 0 & 0 \\ 0 & -3 & 0 \\ 0 & 0 & -3 \end{bmatrix}$$

Note:

- Eigenvalues of the diagonal matrix are its diagonal elements.
- Eigenvalues of the triangular matrix are its diagonal elements.

Ans. ???

Remember

- Eigenvectors are non-zero column vectors. Eigenvectors are Linearly independent. (check for the above example)
- **Eigenvalues** may be equal to zero.
- Eigenvalues are for the given matrix unique but not eigen vectors.
- \clubsuit If X is eigenvector of A corresponding to some eigenvalue λ , then any non-zero multiple of X is also an eigenvector for same λ .
- The Sum of Eigenvalues = Trace of Matrix
- Product of the eigenvalues = determinant of matrix

Ex.6 Find sum and product of eigenvalues of

$$A = \begin{bmatrix} 8 & -6 & 2 \\ -6 & 7 & -4 \\ 2 & -4 & 3 \end{bmatrix}$$

$$\Rightarrow \text{Sum of Eigen values} = \text{Trace of A}$$

= sum of diagonal elements

Product of Eigen values = determinant of A

Ex.6 Two eigenvalues of a 3*3 matrix are -1,2 and if determinant of a matrix is 4, find its third eigenvalue.

❖ Let the third eigenvalue is x.

Product of Eigen values = determinant of A

$$(-1)(2)(x)=4$$

$$x = -2$$

Ex. If
$$A = \begin{bmatrix} sinx & cosecx & 1 \\ secx & cosx & 1 \\ tanx & cotx & 1 \end{bmatrix}$$
 then there does not

exists a rela value of x for which characteristic roots are -1,1&3
